Forgot password

DONE

rihla-website-self.vercel.app/forgot-password.html · forgot-password.html

SUMMARY

In short

- This page is kept out of search on purpose, and that is right. Nothing changed for ranking or in the text.
- It now tells you how often owners ask for a new password, which is the first sign that logging in is giving trouble.
- 6 changes are on the branch: 3 technical, 3 tracking.

SCORECARD

Before and after

WHAT	BEFORE	AFTER
Kept out of search	Yes: noindex, not in the sitemap	Unchanged. Correct for this page.
Google Analytics	Not on the page	Same tag and consent settings as the homepage
Reset requests counted	No	password_reset_requested and password_reset_request_failed
Link clicks tracked	0	5
Cookie notice	None on this page	Shown until the visitor chooses
Layout shift while loading, lab test	0.02	0.02, unchanged

NEEDS YOU

What I could not do for you

Nothing on this page needs you. One note so it does not surprise you later.

LOW

A request for an unknown email still counts as a request

Supabase answers "sent" whether or not the address has an account, so that nobody can use this form to find out who is registered. The page shows "Check your email for the reset link" either way, and `password_reset_requested` fires either way. That is the safe behaviour. It means the count is of requests, not of emails actually sent.

What to do. Nothing to do.

Effort: none

CHANGELOG

What changed on the branch

Everything below is committed on `claude/practical-keller-adcqrc`. The page looks the same.

Technical 3 changes

1. Icons and language, as on the homepage

Added the `favicon.ico` fallback, the iPhone icon and `theme-color`, and set `lang="en-US"`.

2. Same font request as the homepage

The page now sends the identical request, so a visitor arriving from the homepage already has it cached.

BEFORE	`family=Amiri:wght@400;700&family=Manrope:wght@400;500;600;700`
AFTER	`family=Amiri:wght@700&family=Manrope:wght@400;600;700`

3. Taller tap areas

"Back to Rihla" in the top bar was 18 px tall and the footer links 17 px. They are now 42 px and 29 px to tap. Nothing moved.

Tracking 3 changes

4. Google Analytics added

The tag is the homepage's, with the same consent defaults and the same stored choice. It sends the page address without anything that follows a #.

BEFORE	`(no tag)`
AFTER	`gtag.js G-1235J90MCS, consent default denied, reads rihla_consent`

5. `password_reset_requested` and `password_reset_request_failed`

The first fires when Supabase accepts the request, the second when it refuses, for example after too many requests in a row. Neither carries the email address.

AFTER	`gtag('event', 'password_reset_requested') · gtag('event', 'password_reset_request_failed')`

6. `cta_click` on 5 links, and the cookie notice

The cookie notice comes with `site.js`, which this page now loads.

AFTER	`nav_home · forgot_login · forgot_register · footer_email · footer_instagram`

CHECKED

Looked at and left alone

- **noindex, nofollow.** Correct, and the page is not in the sitemap.
- **Title, description and text.** Clear as they are.
- **Share tags and structured data.** Left out on purpose.
- **The reset code.** Untouched apart from the Analytics lines. The link in the email still leads to the reset page.

AFTER YOU PUBLISH

How to check it worked

Do these once the branch is published.

1. Ask for a reset link for an account you own. The email should arrive as before.
2. In GA4, open Reports, then Realtime, after accepting cookies. `password_reset_requested` should appear.

FILES

Files touched

FILE	WHAT CHANGED
`forgot-password.html`	Google tag, two events, click names, icons, fonts, tap areas

METHOD

How this was measured, and what was not

- Audited from the repository and rendered in headless Chrome on a local copy of the site. 26 common checks and 5 page checks pass.
- The checks run against a stand-in for Supabase's library. No email was sent from your Supabase project.
- The live site and the public CDN are unreachable from the audit sandbox, so nothing here was checked in production.
